

Main task:

You must make a layout (**metro-ui.psd is attached**) without using Bootstrap or any other CSS frameworks.

Supported browsers: IE10+, Google Chrome, Firefox. In case you accomplish the third bonus task, support for iOS and Android is required.

Bonus tasks:

1. Create pressed states for tiles. You may either create an effect similar to Windows Phone 8 or show your own vision.

2. Add CSS animation/transition upon directing the pointer at the tile. Select the effect at your discretion. This could be changing color, turn/shift of the icon, or anything else.

3. Responsive design. The layout must adapt to mobile devices. The minimal supported screen width is 320px.

Since it's not always possible to check it on real mobile devices, it's enough to make the layout look good in Google Chrome emulation mode. <https://developer.chrome.com/devtools/docs/mobile-emulation>.

Good luck!
